This course applies microeconomic theory to analysis of public policy. It builds from the microeconomic model of consumer behavior and extends to operation of single and multiple markets and analysis of why markets sometimes fail. We will study empirical examples to evaluate theory, focusing on the casual effects of policy interventions on economic outcomes.

14.03 Fall 2000 Problem Set 7 Solutions Theory: 1. If used cars sell for \$1,000 and non-defective cars have a value of \$6,000, then all cars in the used market must be defective. Hence the value of a defective car is \$1,000. Since consumers are risk neutral, the price of a new car is equal to the expected value of a new car:

14.03 Fall 2000 Problem Set 7 Solutions Theory

Applied economics is the application of economic theory and econometrics in specific settings. As one of the two sets of fields of economics (the other set being the core), it is typically characterized by the application of the core, i.e. economic theory and econometrics to address practical issues in a range of fields including demographic economics, labour economics,

Applied economics is the use of the insights gained from economic theory and research to make better decisions and solve real-world problems. Applied economics is a popular tool in business ...

This is a book on applied microeconomics. It has been designed for the many classes given each year for students who want to learn to become better managers, public officials, lawyers, or members of other such professional groups. While the book's general structure and approach remain much the same in this edition as in the previous one, there are many noteworthy improvements.

A central concern of economics is how society allocates its resources. Modern economies rely

Read PDF Applied Microeconomics Problem Set With Solutions

on two institutions to allocate: markets and governments. But how much of the allocating should be performed by markets and how much by governments? This collection of readings will help students appreciate the power of the market. It supplements theoretical explanations of how markets work with concrete examples, addresses questions about whether markets actually work well and offers evidence that supposed "market failures" are not as serious as claimed. Featuring readings from Hayek, William Baumol, Harold Demsetz, Daniel Fischel and Edward Lazear, Benjamin Klein and Keith B. Leffler, Stanley J. Liebowitz and Stephen E. Margolis, and John R. Lott, Jr., this book covers key topics such as:

- Why markets are efficient allocators
- How markets foster economic growth
- Property rights
- How markets choose standards
- Asymmetric Information
- Whether firms abuse their power
- Non-excludable goods
- Monopolies

The selections should be comprehended by undergraduate students who have had an introductory course in economics. This reader can also be used as a supplement for courses in intermediate microeconomics, industrial organization, business and government, law and economics, and public policy.

Read PDF Applied Microeconomics Problem Set With Solutions

This book provides a rigorous grounding in a popular and fast-growing technical field, which is multidimensional poverty measurement. After studying this book, perhaps alongside the associated website resources, readers with a quantitative training will be able to construct, report, and interpret multidimensional poverty measures, as well as to do basic analysis of them. Some chapters of the book, particularly 7, 8, and 9, presume that readers are familiar with quantitative methods; others do not require any background at all.

This insightful book offers a new way of looking at the arts, culture and the creative industries from the perspective of evolutionary economics. The creative industries are key drivers of modern economies. While economic analysis has traditionally advanced a market-failure model of arts and culture, this book argues for an evolutionary market dynamics or innovation-based approach. Jason Potts explores theoretical and conceptual aspects of an evolutionary economic approach to the study of the creative economy. Topics include creative businesses and labour markets, social networks, innovation processes and systems, institutions, and the role of creative industries in market dynamics and economic growth.

Each chapter of this dissertation studies a different question within the field of Applied Microeconomics. The first chapter examines the mid- and long-term effects of the 1998 Asian Crisis on the educational attainment of Indonesian children ages 6 to 18, at the time of the crisis. The effects are identified as deviations from a linear trend for specific age groups using data from the Indonesian Family Life Survey (IFLS) and Census data. Contrary to previous

Read PDF Applied Microeconomics Problem Set With Solutions

studies, I find that the crisis had negative mid-term effects on the probability of attending school (5 to 7 percentage points) and grade progression (5 to 14 percentage points) of older children, aged 13 to 18 at the time of the crisis. Similarly, these children lost around 0.5 years of education and increased the numbers of hours worked, suggesting that the income effect (lower income) dominated the substitution effect (lower opportunity cost of school). More importantly, the evidence points to large long-term negative effects of around 1.5 years of education for these same children, about twice the increase of the average educational attainment in the last decade. There are also adverse long-term effects on high-school graduation rates and real wages; where the latter are largely (but not fully) explained by the lower educational attainment. The second chapter explores the causal effect of peer feedback on the teaching performance of graduate teaching assistants (TAs) using a Randomized Control Trial (RCT). The participants of the intervention were the TAs of the Department of Economics of a large public university, and the duration of the intervention was one academic quarter. We analyzed the students' evaluations of these TAs, both for the quarter in which the intervention took place as well as for the following quarter, and the students' raw grades for the quarter in which the intervention took place. The results show an effect of almost one half of a standard deviation for the students' TA evaluations in the quarter following the intervention. Nonetheless, the intervention had no effect on the student evaluations of the concurrent quarter, suggesting that it takes time for TAs to adjust their teaching practices. A detailed analysis of the TA evaluations for the following quarter suggests that the intervention had a large effect on the TAs' communication skills, and a more modest effect on the following aspects: concern with student learning, organization, and interaction with students. Finally, the third chapter

Read PDF Applied Microeconomics Problem Set With Solutions

studies risk sharing and heterogeneous risk preferences. More specifically, it introduces a simple test that incorporates risk preference heterogeneity in the traditional test of efficient risk sharing, overcoming a problem previous studies may have encountered: rejecting the efficient risk sharing hypothesis even when it was true. The requirement to implement this test is a household panel data set with considerable waves, that besides expenditure and income recordings contains a measure of risk preferences. To my knowledge, no dataset fulfills all these requirements at the moment, so I develop an alternative way to incorporate risk preference heterogeneity into the analysis: implement the traditional test within groups of households that share the same risk preferences, using the Mexican Family Life Survey (MXFLS). I use a measure of risk aversion to classify households in one of six groups (in which homogenous risk preferences are likely to hold, as required by the traditional test) and implement the traditional test within each of these groups. The results show that within-groups efficient risk sharing is rejected in almost 60% of the cases, mainly when the total household income is considered as the relevant income variable (as opposed to non-labor income). Further refinement of the risk groups result in low power as a result of few observations in the sub-groups.
