A Synopsis of Biology summarizes the entire field of biology using a telegraphic style. The discussions are organized around seven themes: form and structure (morphology); functions (physiology); organism and environment (ecology); evolution and heredity (genetics); plant classification (systematic botany); animal classification (systematic zoology); and applications of biology (applied biology). Comprised of seven sections, this book begins with a detailed account of the morphology of living and non-living things, followed by an assessment of the origin of life. The reader is then introduced to reproduction (vegetative, sexual, and asexual); plant and animal tissues; seeds and seedlings; and metameric segmentation. Subsequent chapters explore matter and energy; organic and inorganic compounds; dermal excretion and thermo-regulation; periodicity and seasonal phenomena; and the life of rivers and lakes. The book also examines parasitism; mating and courtship; natural, artificial, and sexual selection; cultivation of plants; and domestication of animals. This monograph will be useful to research workers, degree students, and others interested in biology.
