Case Studies in Environmental Ethics is a collection of more than 40 case studies covering diverse topics such as: genetic engineering, aesthetics, pollution, animal rights, population, and resource management. It is intended as a supplemental book for college courses primarily in Environmental Ethics. Each case presents factual information on a particular topic, followed by a discussion of the ethical implications of each topic and several insightful discussion questions. The cases are concise yet rich in detail and controversy to provide significant classroom discussion. These cases focus on philosophical and policy decisions that students are likely to encounter in their everyday lives. In addition, the book provides numerous sources and an Internet resources section to allow students to research the issues found in the cases.

In June 2008, the rivers of eastern Iowa rose above their banks to create floods of epic proportions; their amazing size—flowing in places at a rate nearly double that of the previous record flood—and the rapidity of their rise ruined farmlands and displaced thousands of residents and hundreds of businesses. In Cedar Rapids, the waters inundated more than nine square miles of the downtown area; in Iowa City, where the flood was also the most destructive in history, the University of Iowa's arts campus was destroyed. By providing a solid base of scientific and technical information presented with unusual clarity and a wealth of supporting illustrations, the contributors to this far-reaching book, many of whom dealt firsthand with the 2008 floods, provide a detailed roadmap of the causes and effects of future devastating floods. The twenty-five essays fall naturally into four sections. "Rising Rivers, Spreading Waters" begins by comparing the 2008 floods with the midwestern floods of 1993, moves on to trace community responses to the 2008 floods, and ends by illuminating techniques for forecasting floods and determining their size and frequency. "Why Here, Why Now?" searches for possible causes of the 2008 floods and of flooding in general: annual crops and urban landscapes, inflows into and releases from reservoirs, and climate change. "Flood Damages, Flood Costs, Flood Benefits" considers the complex mix of flood costs and effects, emphasizing damages to cities and farmlands as well as potential benefits to natural communities and archaeological sites. "Looking Back, Looking Forward" lays out approaches to managing the floods of the future that are sure to come. While the book draws most of its examples from one particular region, it explains flooding throughout a much larger region—the midwestern Corn Belt—and thus its sobering yet energizing lessons apply well beyond eastern Iowa. By examining the relationships among rivers, floodplains, weather, and modern society; by stressing matters of science and fact rather than social or policy issues; and by addressing multiple environmental problems and benefits, *A Watershed Year* informs and educates all those who experienced the 2008 floods and all those concerned with the larger causes of flooding.
